Fast Acting and Long Lasting

“In combination with topical therapies, the CoolBreeze laser has a significant effect in the treatment of acne and the treatment is a favorite of our patients as well.”

David Vasily, MD
Aesthetica Cosmetic and Laser Center
Bethlehem, PA

There is a clear distinction between the CoolBreeze laser treatment and lengthy acne treatment options. This fast laser light procedure effectively targets and shrinks oil glands - the source of continued breakouts that can lead to scarring.

Cleared by the U.S. Food & Drug Administration, CoolBreeze treatments are long lasting, fast acting and safe for all skin types including tanned and dark-skinned patients.

How does the CoolBreeze laser treatment work?

Unlike other therapies that address bacterial symptoms only, CoolBreeze treats the source of acne, the overactive sebaceous glands. During a CoolBreeze treatment your doctor applies laser energy in gentle pulses over the treatment area. The energy penetrates deep enough to shrink oil glands and decrease their capability to produce acne without affecting the oils necessary for healthy skin. The laser’s heat also gently stimulates the dermal tissue, which triggers a repair mechanism, and your body begins to rebuild and replenish your own natural collagen without injury to the skin’s surface. As new collagen is produced, acne scars begin to disappear and your skin begins to look and feel softer and smoother.

How will you look after a treatment?

You may experience mild redness in the treated area for a short period of time following the procedure. There is no downtime and you can resume regular activities immediately after the treatment – and even apply make-up, if desired.

What improvement will you see?

You will notice significant reduction of acne and improved appearance of acne scars. Results are achieved through a series of treatments and follow-up visits may be required to prolong your improvements.

How many treatments will I need?

Typically, it takes more than one treatment to achieve the optimum level of improvement. On average, patients receive 3 to 6 treatments at monthly intervals.

I have dark skin, is the CoolTouch laser treatment right for me?

Unlike some lasers whose wavelengths aren’t appropriate for darker skin, the CoolTouch laser uses a 1320 nanometer wavelength which targets water in the skin, not melanin. This means the laser will safely treat any skin color without causing pigment or color changes to your natural skin tone.
