

CoolLipo™ Benefits

- Only local anesthesia is needed
- Short procedure in your physician's office
- Safe with minimal bruising and side effects
- Minimal downtime post-procedure (applies to smaller areas such as chin/neck treatment)
- Safe for all skin types, including darker skin

COOL LIPO™

Laser-Assisted
Lipolysis Treatment
Overview

New Technology for an Age Old Problem

As we grow older our skin begins to show the signs of sun, lifestyle and aging. The face and neck are exposed to

the sun more than any other part of the body; therefore they both tend to age more quickly. As these aging effects begin to appear we look for topical formulas and non-invasive treatments to help reduce future aging plus improve current appearance. Many prefer not to undergo extensive surgical face and neck lifts due to the expense and risk. Additionally, these procedures require a lengthy time for the face and neck to heal, not always an option for people with limited time for recovery.

CoolLipo™ (laser-assisted lipolysis) is a minimally invasive laser-based procedure that breaks up and removes fat from both larger and smaller areas of the body. In addition to fat removal, the unique wavelength of the CoolLipo laser system directly contracts collagen and tightens the

skin from the inside out, an effect not seen with standard liposuction.

COOL LIPO™ CoolLipo™ Procedure

The CoolLipo treatment is performed in your physician's office. You are awake during the entire procedure. (Your physician may prescribe a sedative prior to the procedure.) The treatment area is anesthetized and a small cannula (wand-like apparatus which contains the laser fiber) is inserted into an incision through the skin into the treatment area. The physician maneuvers the cannula/laser fiber within the treatment area making contact with the fat under the skin. The laser energy disrupts and liquefies the fat which is then removed by syringe or micro-cannula. After the procedure, a steri-strip is applied to the small incision(s) and the treated area is wrapped with a compression bandage. Your physician will provide instructions regarding activity level and direction as to when you are able to remove the compression bandage.

- **How long does the procedure take?**

The length of the procedure depends on the area being treated with the average being one hour for an individual area.

- **How long will it take for the treated area to heal?**

The healing time frame depends on each patient's procedure and individual healing abilities. The small incision should heal within days and depending on your situation you may have minimal, if any, bruising.

- **How long before I notice results?**

Patients should see results within a week post-procedure and will also notice a continual improvement of skin texture and tightness in the treated area 2-6 months post procedure.

- **Can the CoolLipo laser treatment be performed on my stomach, hips or other larger body areas?**

The CoolLipo laser utilizes a special suction handpiece which allows the physician to remove fat and tighten the skin simultaneously. This makes CoolLipo the ultimate choice for treating the larger areas such as the abdomen, buttocks, legs and arms.

- **Why should I choose CoolLipo laser treatment over other similar laser-assisted lipolysis procedures?**

CoolLipo's unique 1320 nm wavelength provides proven skin tightening and lifting benefits in addition to fat lipolysis. The 1320 wavelength has been proven to be safe with all skin types from very fair to dark skin.
